The Evolution of Fuzzing in Finding the Unknowns

About me!

- Googler
- Principal Engineer/Manager, Google Open Source Security Team (GOSST)
- TAC member, Open Source Security Foundation (OpenSSF)
- Founding Chrome Security member

A

2009-2010: It works!

- <u>Prototype</u> fuzzing at scale on Google Borg
- First example of "corpus distillation"
- Media parsers are hard to get right
- Simple mutations (e.g. bitflipping)

Figure 1: The high-level architecture of Borg. Only a tiny fraction of the thousands of worker nodes are shown.

2011-2012: Figure out the pipeline

- <u>Continuous fuzzing using ClusterFuzz</u>, as part of SDLC
 - Build management
 - Task management
 - Test management
 - Crash management
 - Regression analysis
 - Fix verification

2012-2013: The rise of the Sanitizers

- Valgrind was impractical for efficient fuzzing
- Lack of instrumentation impacted reliability, usefulness
- Address, Memory, Thread, UndefinedBehavior Sanitizers
 - Fast (~1.5x slowdown),

reproducible, insightful results

• Testcase Deduplication V1

Google

• Security Asserts enabled builds

2014-2015: Smart coverage guided fuzzing

- American Fuzzy Lop (AFL)
 - Supports binary, source-code instrumentation
 - Out-of-process fuzzing (+later <u>in-process</u>)
- libFuzzer
 - Support source-code instrumentation only
 - In-process fuzzing
 - Developer focused, fuzzer unit-tests
 - Custom mutators for structure-aware fuzzing

2014-2015: Smart coverage guided fuzzing (cntd)

```
#include "libxml/parser.h"
extern "C" int LLVMFuzzerTestOneInput(
    const uint8 t * data, size t size) {
  auto doc = xmlReadMemory(data, size,
"noname.xml",
                           NULL, 0);
  if (doc) {
    xmlFreeDoc(doc);
  return 0;
```

ID	2	Product	Summary

2016-2017: Scaling with the community

- OSS-Fuzz service launched to fuzz open-source
- Regressions reported in a few hours
 - Automation+Ease of use=90% fix rate
- Community input drove key features
 - Code coverage reports
 - Custom mutators
 - Ideal integrations

2016-2017: Scaling with the community (cntd)

Internal FuzzIts

External OSS-Fuzz Rewards

To qualify for these rewards, a project needs to have a large user base and/or be critical to global IT infrastructure. Eligible projects will receive \$1,000 for initial integration, and up to \$20,000 for ideal integration (the final amount is at our discretion). You have the option of donating these rewards to charity instead, and Google will double the amount.

2018-2019: Open Sourced ClusterFuzz

- Testcase deduplication v2, high-quality automated filing
- Fuzz target performance analyzer
- Efficiency improvements
 - Corpus enhancements: cross-pollination, radamsa, etc
 - Distributed corpus sharing and pruning
- Cross-platform (Win, Linux, Mac, Android)
- First-class support for external fuzzers

2020-2021: Real-world benchmarking

- FuzzBench service <u>launched</u> to compare fuzzer efficacy
- Why it worked well?
 - Zero cost for large-scale experiments (4K cores)
 - Diverse, real world OSS-Fuzz benchmarks
 - Automated, easy to use workflows
 - Reproducible results
 - Support for private experiments

2020-2021: Real-world benchmarking (cntd)

- Fuzzing engine improvements
 - libFuzzer, honggfuzz (interceptors, corpus size, input scheduling, etc)
 - Developer testbed <u>AFL++</u>
- Validation for fuzzing research
 - Entropic, SymQEMU,

StateAFL, WAFL, E9AFL,

Google <u>AFL-HIER</u>, <u>BigMap</u>, etc

2022 and future: Predictions for the future

- Prioritized list of fuzzing chokepoints
- Coverage-guided property-based tests
- Non-memory corruption sanitizers
- Practical concolic execution
- Your ideas?
